I'm a new, but well-rounded software developer looking for an opportunity to take part in a team with experienced devs where I can learn and contribute

EXPERIENCE

Junior Full Stack Developer, Red Sky Technologies, Aug 2018—Sep 2019

- Automated our entire testing environment at the time in Selenium JS
- Redid the UI and developed several CRUD applications on the admin portal for VR Junkies and Private Label VR
- I took over the development of the mobile app `VR Junkies`, finished development, and got it published on both Apple, and Google Play stores
- Finished the development of a sales monitoring dashboard in electron that displayed real time sales data along with geo-locational visuals
- Built features and styles for mobile applications using `PhoneGap` and `React`

Front End Internship, Pattern, Lehi UT, Nov 2019 — October 2019

- I built out simple features using `React` and `React hooks` for in company software suite `Predict`
- Worked with previously developed REST api calls to dynamically update pages when typing in a search input box for products and companies
- Added to the CSS to reflect changes that had been made in the mock-ups

JavaScript Internship, Namify, February 2020 — March 2020

- During my time at Namify, I was tasked with building out a Testing Framework that would work from input in the command line and take in several different flags to perform different tasks accordingly.
 - I used several different libraries and Frameworks to accomplish this, including `readline-sync`, `Selenium Webdriver`, `Mocha` and `Chai`.
 - The project I built out would take in several different flags, and was able to change between headless and non-headless modes, take in different users, passwords, and run tests on different stores dynamically.
 - I used Async/Await and practiced OOP to organize tests in different classes of suites so that there would be several options for which testing suite you would want, or give you options to single out tests all from the command line
-

Junior Software Engineer, Mindfire Technology, March 2020 — Current

- At Mindfire we do consulting and software for several different clients, I have gotten to experience a very fast paced environment with quick project completion rates.
- I have built out several CRUD features using React, Redux and TypeScript across multiple project bases.
- I have used the Reactstrap and Bootstrap libraries, we have a practice of trying to write as little CSS as possible and implement as many Bootstrap classes as we can.
- I have gained exposure to and worked with .NET and Docker containers/ images.
- I have built out tables populated on login.
- Authentication forms using JWT, storing tokens to keep a user logged in.
- Filters options and logic populated dynamically based on what data is in tables.
- React routing to create Single Page Web Applications.

Technical Skills

HTML CSS JavaScript Python GIT/Source Control
Reactstrap BootStrap jQuery TypeScript SCSS
Node.js Flask MySQL MongoDB
React Redux React Native/Expo
SeleniumJS Chai Mocha

EDUCATION

Mountainland Technical College, Web Design and Development
January 2018 — May 2019
